Information for Students Enrolled in Classes Using Vertebrate Animals at UCSB

You are being provided with this information sheet because you are enrolled in a UCSB course that will be using vertebrate animals. It will provide you with general information on health issues and legal responsibilities relating to the use of vertebrate animals in teaching and research. The information herein is related solely to the use of VERTEBRATE animals in teaching and research.

Is it OK to use vertebrate animals in academic courses?
Before vertebrate animals can be used in either teaching or research settings at UCSB, the proposed procedures to be used must be reviewed and approved by the UCSB Institutional Animal Care and Use Committee (IACUC), which assesses the procedures to be employed as well as the relevance/justification of the proposed vertebrate animal use. The IACUC is a federally mandated committee (under the Animal Welfare Act) composed of scientists, non-scientists, the campus veterinarian and at least one community member. Vertebrate animal use for teaching or research can only proceed after IACUC approval has been achieved.

Where do vertebrate animals live at UCSB and who cares for them?
The vast majority of the animals used in teaching and research at UCSB are rodents and they are housed in facilities designed for this purpose. Ventilation, temperature regulation, food and housing are all carefully monitored and properly maintained. Day-to-day care of these animals is performed by our campus veterinarian and his staff. The UCSB campus veterinarian is responsible for overseeing the husbandry and veterinary clinical care of all vertebrate animals associated with UCSB teaching and research activities, on and off campus.

Are there potential risks to people when they use vertebrate animals in a classroom or other academic setting?
Yes. Whenever people are in contact with vertebrate animals, there are risks that should be considered. The most common risks fall into three categories:

[i] Allergies, which can develop following contact with vertebrate animals (allergic symptoms include nasal stuffiness, running nose, sneezing, red or irritated eyes and in some cases may present with a cough and possibly asthma);
[ii] Physical, such as bites or scratches; and
[iii] Diseases, specifically those that can be transferred from vertebrate animals to humans. The specific risks depend on the species of animal being contacted.

The most common problem for people working with vertebrate animals is the development of allergies, usually to mice or rats, especially if you have a family history of allergies such as hay fever, asthma, or eczema. Your professor should provide you with information about the potential risks posed by the vertebrate animals you will work with in class. Additional information can be found at http://safetyapps.ucdavis.edu/IACUC/risktool/index.cfm

How should I protect myself when using vertebrate animals for coursework?
• Allergy – While your exposure to animals in class will generally be infrequent and relatively brief in duration and it is unlikely that you will develop an allergy. However, you should err on the side of caution. Wearing gloves, washing your hands, and even wearing a dust mask (also known as a filtering-face piece respirator) are recommended (and may be required in some
classes). Avoid bringing the vertebrate animal close to your face and consider changing and washing your clothes as soon as possible after your class.

• Physical Risks – You may or may not handle vertebrate animals during your coursework, but if you do so, your instructor will teach you how to handle the vertebrate animals appropriately. Proper handling protects both you and the vertebrate animals.

• Disease - There are very few zoonotic diseases (ones that can be transferred to humans) present in the vertebrate animals housed on campus. Nonetheless, always wear gloves and wash your hands after handling vertebrate animals.

What is the UCSB Occupational Health and Safety Program?
In order to identify individuals who might be at risk from allergies and zoonotic diseases, the UCSB IACUC and Office of Environmental Health and Safety (EH&S) has created an Occupational Health and Safety Program (OHSP). This program enables personnel (including students) working with vertebrate animals to fill out a confidential medical review form that is reviewed by an Occupational Health Medical Physician who evaluates the potential health risks related to the vertebrate animal work. If the physician determines that there is a possible health risk, then s/he provides a recommendation for an appropriate course of protection. Depending on the vertebrate animals and activities in your class, you may wish to enroll in the OHSP for vertebrate animal users. The OHS enrollment form is accompanied with this Information Sheet and is also available at http://www.research.ucsb.edu/media/11487/ohs_form.pdf.
You may request participation in the OHSP by filling out the enrollment form and submitting it to the IACUC Office in a signed sealed envelope with your name, course, instructor and course number clearly labeled on the outside of the envelope. These will be handled confidentially by the OHS Physician.

What else should I do?
1. Learn how to handle vertebrate animals properly. Ask questions if you are unsure of anything.
2. Understand the potential risks of your activities and know the relevant signs or symptoms of potential problems. Make use of appropriate protective equipment. Always ask if anything is not clear.
3. Read and understand the IACUC Animal Care and Use Protocol associated with your course. Your professor can provide you with a copy of the protocol.

Who do I contact for more information?
The IACUC can be contacted at iacuc@lifesci.ucsb.edu or by contacting the IACUC Coordinator at 805-893-5855. When calling, it is best to identify yourself as a student in a class that uses vertebrate animals and the course number.
